

Requested ERP Functionality Investigation and Development Work

Date: 8/4/2026

Rev: 2

ERP System: Odoo.SH (Self Hosted), Version 18

Note: The following items represent identified business needs, process deficiencies, and desired functionality. In several areas, Right Weigh has not yet completed a detailed functional requirements analysis. Where requirements are not fully defined, the expectation is that the developer will review standard Odoo functionality, identify capability gaps, and provide recommendations for configuration, process changes, or custom development.

Phase 1 – Purchasing / Procurement

Custom Re-Order Suggestion Automation

Implement automated purchasing re-order suggestion functionality to supplement and extend native replenishment capabilities.

- Add fields to item record.
 - ‘Automated Reorder Suggestions’ – Determines whether the SKU is included in the automated purchasing re-order suggestion flow.
 - [Boolean value; available only when Track Inventory = True, Can be Purchased = True, and Buy route is enabled; automatically set to False if any prerequisite is subsequently removed]
 - ‘Inventory Turns Target’ – Target number of times inventory should be sold and replaced per year.
 - [Required if Automated Reorder Suggestions = True, numerical value, only allow positive values]
 - ‘Safety Factor’ – Number of weeks of demand to hold as safety stock.
 - [Required if Automated Reorder Suggestions = True, numerical value, only allow positive integers]
- Add fields to ‘product.supplierinfo’ model (displayed under item’s purchasing tab):
 - ‘Lead-time’ – Total duration, in weeks, between the initiation of purchase order and delivery of the goods.
 - Must sync with native ‘delay’ field (lead time in days):
 - If either field is manually updated, the other should automatically sync to match.

- [Required field, numerical value, only allow positive integers]
 - 'Standard Case Quantity' – Rounding-factor used to set 'To-Order Quantity' of goods.
 - [Required field, numerical value, only allow positive integers]
- Add fields to 'stock.warehouse.orderpoint model':
 - 'Min' – Auto-calculated reorder point quantity.
 - [Read-only, calculated ROP value]
 - See calculations below for ROP.
 - If corresponding SKU has no vendor established in 'product.supplierinfo' model, display *"-" in custom replenishment page.*
 - 'Max' – Auto-calculated order up to quantity.
 - [Read-only, calculated Max value]
 - **Max = Forecast + Final TOQ**
 - If corresponding SKU has no vendor established in 'product.supplierinfo' model, display *"-" in custom replenishment page.*
 - 'To Order' – Auto-calculated to order quantity.
 - [Read-only, calculated Final TOQ value]
 - See calculations below for Final TOQ.
 - If corresponding SKU has no vendor established in 'product.supplierinfo' model, display *"-" in custom replenishment page.*
 - 'Vendor' – Preferred vendor used for automated replenishment suggestions.
 - [Read-only]
 - Value should be populated from preferred vendor for corresponding company, respective to Odoo's native behavior (list sequence determines preference).
 - *If SKU has no vendor established in 'product.supplierinfo' model, display "WARNING! No supplier info" in custom replenishment page.*
- Update pre-existing native fields:
 - 'min_quantity' (product.supplierinfo model)
 - [Only allow positive integers]

- Use above custom fields in conjunction with pre-existing native fields to complete the following automation sequence:
 1. Tally 'Raw-Goods Demand' (RGD) per SKU using the following criteria:
 - a. Demand shall be based on quantities on confirmed SO, regardless of order fulfillment status.
 - b. Demand shall include:
 - i. Direct SO Demand = Quantity of SKU on confirmed SOs; and
 - ii. Indirect Demand = Demand generated by confirmed SOs for parent SKUs containing the item, whether directly or through one or more levels of subassembly BOMs.

RGD = Direct SO Demand + Sum of (Parent SKU Demand × BOM Qty) across all Parent SKUs and BOM levels.

Note: Manufacturing Orders, procurement orders, replenishment records, and other downstream demand sources shall not be included in the demand calculation, as they represent derived demand originating from Sales Orders. Additionally, Sales Orders in quotation or cancelled status shall also be excluded from demand calculation.

Sales Order lines with negative quantity should be excluded from the demand calculation.

***Sales Order lines using the Dropship route shall be excluded from the RGD calculation.** Dropship Sales Order lines represent demand fulfilled directly by the designated vendor and shall not be treated as demand against the selling company's inventory or production.*

For intercompany dropship transactions, the originating Dropship Sales Order line shall therefore be excluded from RGD, while the corresponding Sales Order generated for the Right Weigh company physically supplying the goods shall be included in RGD in accordance with the standard criteria above.

For Indirect Demand, always use the latest active BOM revision to calculate Raw-Goods Demand throughout entire lookback period.

2. Check 'Created On' date of sold SKU:

a. For SKUs where 'Created On' is within -3 months:

i. Calculate Total 'Weekly Average Raw-Goods Demand' (WAD):

- **Total WAD = Total RGD since creation date / weeks since date of creation**

b. For SKUs where 'Created On' is not within -3 months:

i. Calculate 'Weekly Average Raw-Goods Demand' (WAD) for the following periods:

- **Last 12-Month WAD = Total RGD in last 365 days / 52**
- **Last 6-Month WAD = Total RGD in last 182 days / 26**
- **Last 3-Month WAD = Total RGD in last 91 days / 13**

c. Determine 'Greatest WAD':

Greatest WAD = IF(Created On is within -3 months, Total WAD, MAX>Last 12-Month WAD, Last 6-Month WAD, Last 3-Month WAD))

Note: RGD demand lookback periods shall be based on SO creation date.

3. Calculate 'Reorder Point' (ROP) using greatest of the above 3 averages:

ROP = Greatest WAD * (Lead-time [weeks] + Safety Factor [weeks])

Note: Lead-time value should be read from preferred vendor for corresponding company, respective to Odoo's native behavior (list sequence determines preference). If SKU has no vendor established in 'product.supplierinfo' model, stop calculation and trigger warning in custom replenishment page (do not populate min, max or to-order values).

4. Use Odoo's native 'Forecasted' quantity to determine if SKU is below ROP and needs to be reordered:
 - a. If Forecasted < ROP:
 - i. Trigger Reorder Flag = True
 - b. Else:
 - i. Trigger Reorder Flag = False
5. Calculate 'To-Order Quantity' (TOQ) for records with Reorder Flag = True:
 - a. Base TOQ = (Greatest WAD * 52) / Inventory Turns Target
 - b. ROP Shortfall = ROP – Forecasted
 - c. Unrounded TOQ = Base TOQ + ROP Shortfall
 - d. MOQ-Adjusted TOQ = MAX(min_quantity, Unrounded TOQ)
 - e. Final TOQ = ROUNDUP(MOQ-Adjusted TOQ / Standard Case Quantity, 0) × Standard Case Quantity

Note: min_quantity and Standard Case Quantity value should be read from preferred vendor for corresponding company, respective to Odoo's native behavior (list sequence determines preference)

6. Use Final TOQ to generate replenishments in a custom replenishments page.
(see stock.warehouse.orderpoint model)
 - a. Custom replenishment page shall:
 - i. be separate from native replenishment page;
 - ii. utilize the native replenishment page as a reference for layout and workflow;
 - iii. reuse native fields, actions, and business logic wherever possible;
 - iv. preserve the general user experience and workflow of the native replenishment page;
 - v. have capability to:
 1. be sorted and grouped by vendor; and
 2. when lines share the same vendor, be grouped together on one PO (native behavior).
 - vi. Fields shall include:
 - a. Product [native]
 - b. Description [native]
 - c. On Order [native]
 - d. On Hand [native]
 - e. Forecast [native]
 - f. Routes [native]
 - g. Vendor [custom]
 - h. Min [custom]
 - i. Max [custom]
 - j. To Order [custom]
 - k. UoM [native]
 - l. Action buttons (Snooze, Reorder, Automate) [native]
 - m. 'View' button [native]
 - b. Native replenishment page and functionality shall remain intact and undisturbed for system integrity.

Supply & Demand Forecast

Implement a Supply & Demand Forecast report to provide visibility into projected component inventory levels and identify potential inventory shortages and overages requiring purchaser review.

Report Layout:

Report shall include:

- Columns representing each Work Week (WW) for 52 WWs, including:
 - Current WW; and
 - 51 Future WWs.
- Rows representing each component, including:
 - 'Component' number; and
 - its 'Forecast Status'.
- Component rows shall be collapsed by default and individually expandable/collapsible to show or hide their associated weekly sub-rows.
- Each component shall include the following weekly sub-rows:
 - 'Beginning Stock' quantity;
 - 'Forecasted Demand' quantity;
 - 'Scheduled Demand' quantity;
 - 'Scheduled Supply' quantity;
 - Associated PO #;
 - 'Projected Stock' quantity, and
 - 'Alert'.

Forecast Status:

Forecast Status shall summarize whether any inventory alerts exist for the component within the applicable **Alert Horizon**. Refer to the **Shortage Alert** and **Overage Alert** sections for Alert calculation criteria. Available statuses shall include:

- **Good** – No Shortage or Overage Alerts identified.
- **Shortage** – One or more Shortage Alerts identified.
- **Overage** – One or more Overage Alerts identified.
- **Shortage & Overage** – Both Shortage and Overage Alerts identified.

The **Component** and **Forecast Status** cells shall be visually highlighted according to the component's **Forecast Status**, allowing components requiring purchaser review to be readily identified while the weekly sub-rows are collapsed:

- **Good** – No highlighting.
- **Shortage** – Red highlighting.
- **Overage** – Yellow highlighting.
- **Shortage & Overage** – Orange highlighting.

Mockup:

The following mockup illustrates the intended organization and presentation of the Supply & Demand Forecast. It is provided for reference and is not intended to prescribe exact UI styling or implementation.

Component	Forecast Status	Week 34 (17-23/Aug)	Week 35 (24-30/Aug)	Week 36 (31-6/Sep)	Week 37 (7-13/Sep)	Week 38 (14-20/Sep)	Week 39 (21-27/Sep)	Week 40 (28-4/Oct)
GO310-54-LM Rev D	Shortage							
Beginning Stock		311	276	256	196	676	656	636
- MAX(Forecasted Demand		20	20	20	20	20	20	20
and Scheduled Demand)		35	15	60	0	0	0	0
+ Scheduled Supply		0	0	0	500	0	0	0
					P05555			
= Projected Stock		276	256	196	676	656	636	616
Alert		-	Shortage	Shortage	-	-	-	-
PN-001-0000 Rev L	Shortage & Overage							
Beginning Stock		1524	1459	1394	1329	1264	2239	2174
- MAX(Forecasted Demand		65	65	65	65	65	65	65
and Scheduled Demand)		35	15	60	0	0	0	0
+ Scheduled Supply		0	0	0	0	1040	0	0
						P05556		
= Projected Stock		1459	1394	1329	1264	2239	2174	2109
Alert		-	-	-	Shortage	Overage	Overage	-
HW-001-0808 Rev 0	Good							
Beginning Stock		3115	2985	2855	2725	2595	2465	2335
- MAX(Forecasted Demand		130	130	130	130	130	130	130
and Scheduled Demand)		70	30	120	0	0	0	0
+ Scheduled Supply		0	0	0	0	0	0	0
= Projected Stock		2985	2855	2725	2595	2465	2335	2205
Alert		-	-	-	-	-	-	-

Field Calculations:

- **Beginning Stock**
 - For current WW:
 - **Beginning Stock = current 'On Hand' quantity**
 - For future WWs:
 - **Beginning Stock = Projected Stock from previous WW**
- **Forecasted Demand = Greatest WAD**
- **Scheduled Demand = RGD from open SO lines due on WW**
- **Scheduled Supply = quantity on open PO lines due on WW**
 - Display the associated PO number(s) for Scheduled Supply.
- **Projected Stock = Beginning Stock + Scheduled Supply – MAX(Forecasted Demand, Scheduled Demand)**

Note: 'Greatest WAD' and 'RGD' are defined in the Custom Re-Order Suggestion Automation section.

When Scheduled Demand is less than the Forecasted Demand, Forecasted Demand is assumed to represent expected future orders not yet entered into the system. When Scheduled Demand exceeds the Forecasted Demand, the Scheduled Demand shall be used instead.

Alerts:

The report shall identify projected inventory conditions requiring purchaser review through **Shortage** and **Overage Alerts**. Alerts shall be evaluated for each component and WW within the applicable **Alert Horizon** and displayed in the corresponding 'Alert' row. All data cells for a WW in which an Alert condition exists shall be visually highlighted according to the applicable Alert type.

- **Shortage Alert** – Identifies projected inventory levels below the defined low-side threshold.
- **Overage Alert** – Identifies projected inventory levels above the defined high-side threshold.

The specific calculation criteria for each Alert type are defined below.

Alert Horizon:

The report shall limit Shortage and Overage Alerts to an applicable **Alert Horizon** for each component.

1. Calculate the **Order-Cycle Duration**:

Order-Cycle Duration [weeks] = 52 / Inventory Turns Target

2. Calculate the **Alert Horizon End** as the later of:
 - **Current WW + Lead-time [weeks] + Order-Cycle Duration**; or
 - Latest scheduled receipt WW from an open PO for the component.
3. Shortage and Overage Alerts shall only be generated for WWs occurring on or before the **Alert Horizon End**.

Note: 'Inventory Turns Target' and 'Lead-time' are defined in the Custom Re-Order Suggestion Automation section.

The purpose of the Alert Horizon is to limit alerts to the period relevant to current purchasing decisions. The 52-week forecast shall continue to display projected supply, demand, and stock beyond the Alert Horizon, but inventory conditions beyond the Alert Horizon shall not generate Alerts.

Shortage Alert:

The report shall support identification of components projected to experience a potential inventory shortage requiring purchaser review.

1. Calculate the **Safety Stock Threshold**:

Safety Stock Threshold = Greatest WAD × Safety Factor [weeks]

2. A **Shortage Alert** shall be generated for each WW in which:
 - **Projected Stock < Safety Stock Threshold**; and
 - The WW occurs within the **Alert Horizon**.
3. WWs meeting the above criteria shall:
 - display **Shortage** in the corresponding Alert row; and
 - have all corresponding data cells highlighted red.
4. If one or more Shortage Alerts exist, the component's **Forecast Status** shall reflect the Shortage condition.

Note: 'Safety Factor' is defined in the Custom Re-Order Suggestion Automation section.

Overage Factor:

Add a global configurable **Overage Factor** setting to establish the acceptable upper inventory threshold used by the Supply & Demand Forecast. The setting shall apply globally to all components included in the report.

- 'Overage Factor' – Number of Base TOQs above Safety Stock before an Overage Alert is generated.
 - [Required field, numerical value, only allow positive values]

Overage Alert:

The report shall support identification of components projected to experience a potential inventory overage requiring purchaser review.

1. Calculate the **Overage Threshold**:

$$\text{Overage Threshold} = \text{Safety Stock Threshold} + (\text{Base TOQ} \times \text{Overage Factor})$$

2. An **Overage Alert** shall be generated for each WW in which:
 - **Projected Stock > Overage Threshold**; and
 - The WW occurs within the **Alert Horizon**.
3. WWs meeting the above criteria shall:
 - display **Overage** in the corresponding Alert row; and
 - have all corresponding data cells highlighted yellow.
4. If one or more Overage Alerts exist, the component's **Forecast Status** shall reflect the Overage condition.

Note: 'Base TOQ' is defined in the Custom Re-Order Suggestion Automation section.

Landed Cost

Enable 'Landed Cost' per SKU.

- Identify if Odoo's native landed cost provisions are sufficient for tracking landed cost, or whether functionality gaps exist.
- Requirements:
 - Define workflow for capturing landed cost inputs in Odoo purchasing/receipt transactions, including:
 - Freight
 - Duties
 - Misc. Service Charges
 - Method for capturing cost inputs must support:
 - Freight and Service costs paid to the vendor (included as lines on the PO); and
 - Freight, Duties, and/or Service costs paid to a 3rd party (not included as line on the PO)
 - Investigate available landed cost allocation methodologies within Odoo and recommend an approach suitable for Right Weigh's purchasing and import workflows.
 - Recommended solution shall support calculation, allocation, and reporting of landed cost at the SKU level.

Currency Management

Investigate options for correcting purchase transactions that have been created and/or received in an incorrect currency.

- Review standard Odoo functionality and recommend an appropriate process for correcting purchase orders and inventory receipts when the incorrect currency has been used.
- Identify available preventative controls and process improvements to reduce the occurrence of incorrect currency transactions.
